INOX debuts industry's only stainless steel combination lock and edge pull
TwistLock™ functions as both the spring-loaded edge pull and locking bolt

SACRAMENTO, CA – [INOX](#) launches TwistLock™, the industry's only lock and edge pull combination offered in stainless steel for increased durability and seamless implementation. The unique "twist lock" feature provides a reliable locking function with an edge pull that rotates to slide a pocket door open or closed.

"The hardware options currently available for a traditional pocket door tend to be poorly made, tough to install and cause the door to jam or stick when opening or closing," said Jeff Howes, President of INOX. "TwistLock offers a solution to all of those issues because it is easy to install and use, durable, and helps the door slide open and closed seamlessly."

TwistLock uses a gear-driven design and an edge pull that functions as both the spring-loaded edge pull and the locking bolt. When turned horizontally, a gear at the back of the lock body works in conjunction with the hub to rotate the edge pull 90 degrees in a secure locking position. When the edge pull returns to the vertical position, the door can be opened and the edge pull can be pushed back into the lock where it will remain until it is activated again.

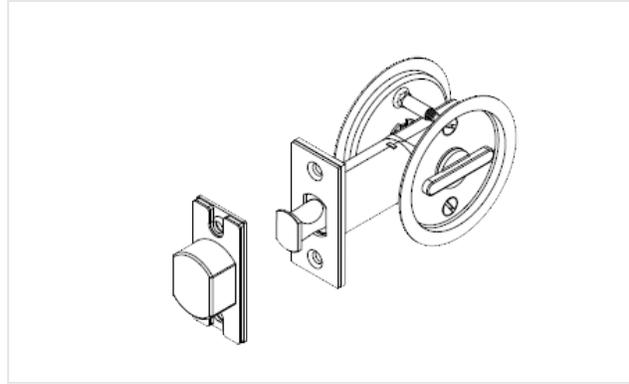

TwistLock is available for either 2 3/8-inch or 2 3/4-inch backset and is the only product of its kind with a Concealed Fastener Trim option.
